ChatGPT for NDIS Plans

SWEN90009-2023-CH-Koala

The National Disability Insurance Scheme (NDIS) is a project founded by government aiming to benefit up to 500,000 Australians with disabilities. Every individual is assessed by the NDIS and receives their "plan" consisting of a budget to support their lives and achieve their goals across fifteen different categories. This includes day-to-day living, capital items, and learning and growth initiatives. However, the process of developing these plans is time-consuming and opaque, which rely on manual processes, planner experience and hidden standards.

In order to overcome these difficulties, Capital Guardians expected to build a publicly available tool with the API of ChatGPT to automate the process and avoiding spending large amount of time on revision. The main propose of project is to implement a free, simple and public tool that can be comfortably used by those who have no financial background, providing them with a streamlined solution to produce suitable plans and budgets.
